2. Phase 1 – Requirement Analysis & Planning

Business Use Case

The school IT helpdesk receives support requests related to network connectivity, hardware failures, account access problems, and system performance. IT staff currently identify the issue type, select category and subcategory, and inform the caller. The manual process is time-consuming, error-prone, and not scalable.

Business Requirements

- Automatically classify IT tickets based on the issue description.
- Assign Category and Subcategory without manual intervention.
- Support dependent choice logic between Category and Subcategory.
- Send an automated email notification to the caller upon ticket creation.
- Store ticket information in a structured and standardized format.
- Ensure easy maintenance and future scalability.
